Python is a high-level, interpreted programming language known for its simplicity and readability. Created by Guido van Rossum and first released in 1991, Python has become one of the most popular programming languages worldwide. Its design philosophy emphasizes code readability with the use of significant indentation, making it an ideal language for both beginners and experienced developers. Python is dynamically typed and supports multiple programming paradigms including procedural, object-oriented, and functional programming. The language is open-source and maintained by the Python Software Foundation, with a large and active community contributing to its continuous development. Today, Python powers applications across web development, data science, artificial intelligence, scientific computing, automation, and countless other domains.
