

Deep Learning Fundamentals

Deep learning is a subset of machine learning that uses neural networks with multiple layers to progressively extract higher-level features from raw input. For example, in image processing, lower layers may identify edges, while higher layers may identify human-recognizable concepts such as digits, letters, or faces. Deep learning architectures such as deep neural networks, deep belief networks, and recurrent neural networks have been applied to fields including computer vision, speech recognition, natural language processing, and more.
